FDVA MINI PROJECT

FIFA WORLD CUP 2026

POWER BI VISUALIZATION WITH CHARTS

Match data analysis • Goals • Results • Group comparisons

PROJECT	FIFA World Cup 2026 Data Visualization
TOOL	Microsoft Power BI
DATA USED	48 group-stage match records
CHARTS	6 charts with short interpretations

Prepared as an academic mini-project report.

1. Introduction

This project demonstrates football match analysis using a sample of FIFA World Cup 2026 group-stage data. Charts summarize match goals, result categories, group scoring and team scoring within the included records.

2. Objectives

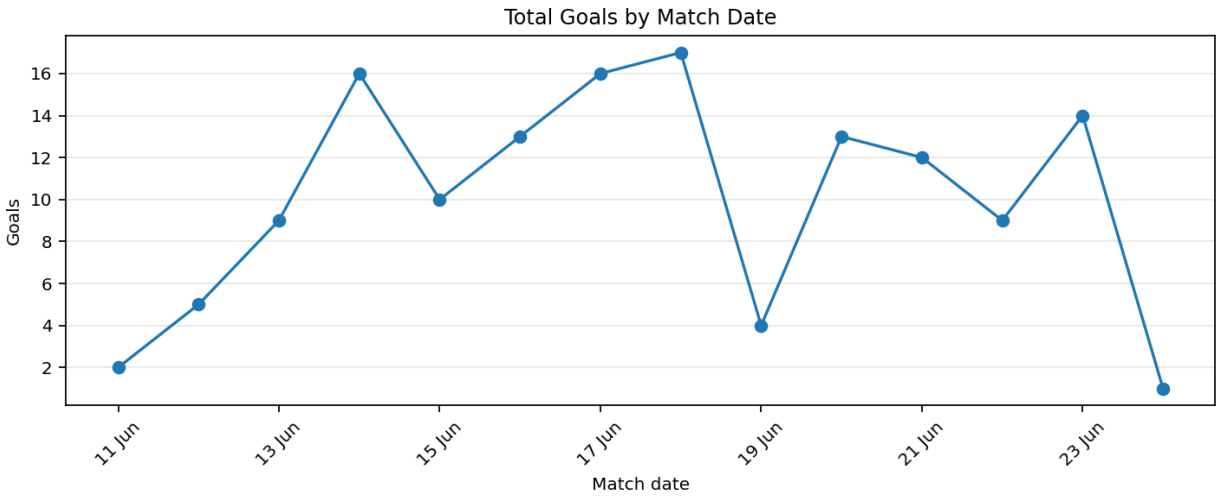

• Visualize goals scored by match date.
• Compare home-team and away-team goals.
• Show the share of wins and draws in the sample.
• Compare total goals across groups.
• Identify teams with the highest goals in the included matches.

3. Dataset fields

Match_ID, Date, Stage, Group, Venue, Home_Team, Away_Team, Home_Goals, Away_Goals, Total_Goals and Result. The PDF charts are calculated directly from the companion CSV dataset.

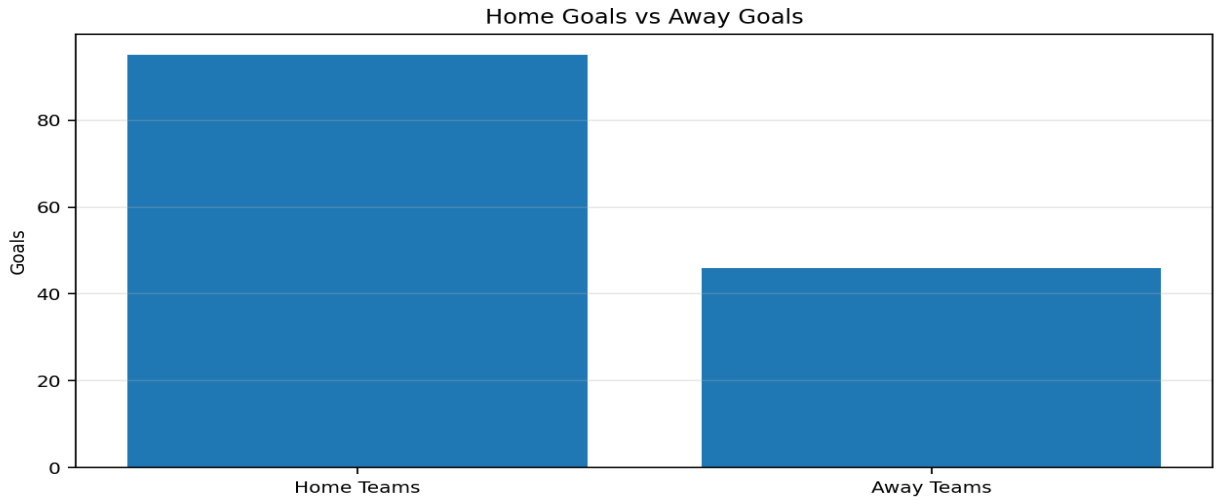

4. Charts and interpretation

Chart 1. Total goals by match date

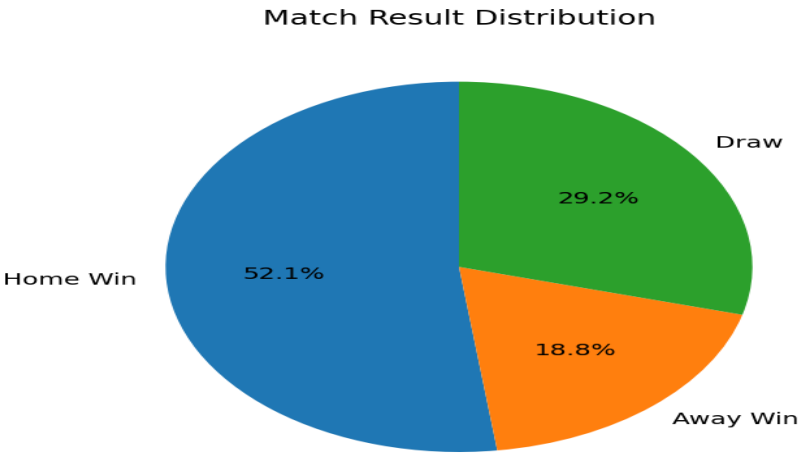

Shows how total goals vary by date across the included matches. Peaks indicate dates with more goals scored in the sample.

Chart 2. Home goals vs away goals

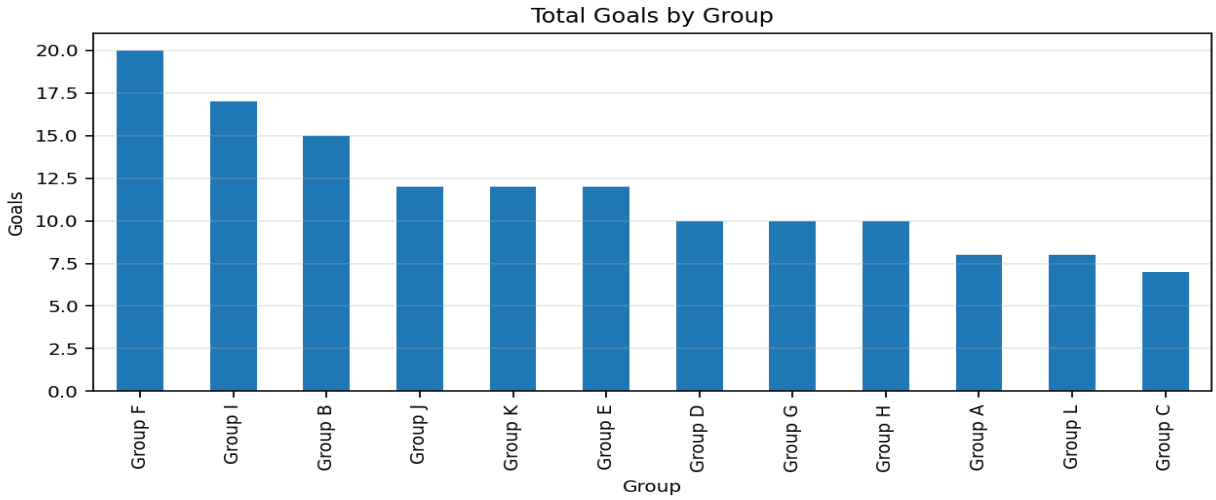

Compares the total goals credited to home-listed teams and away-listed teams in this dataset.

Chart 3. Match result distribution

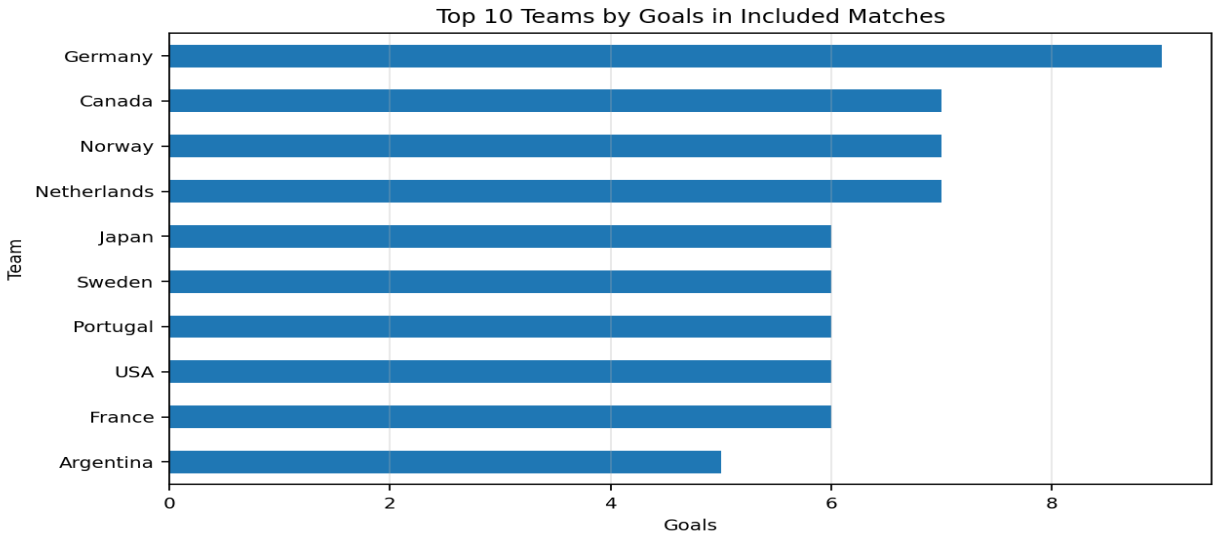

Displays the proportion of home wins, away wins and draws among the included match records.

Chart 4. Total goals by group

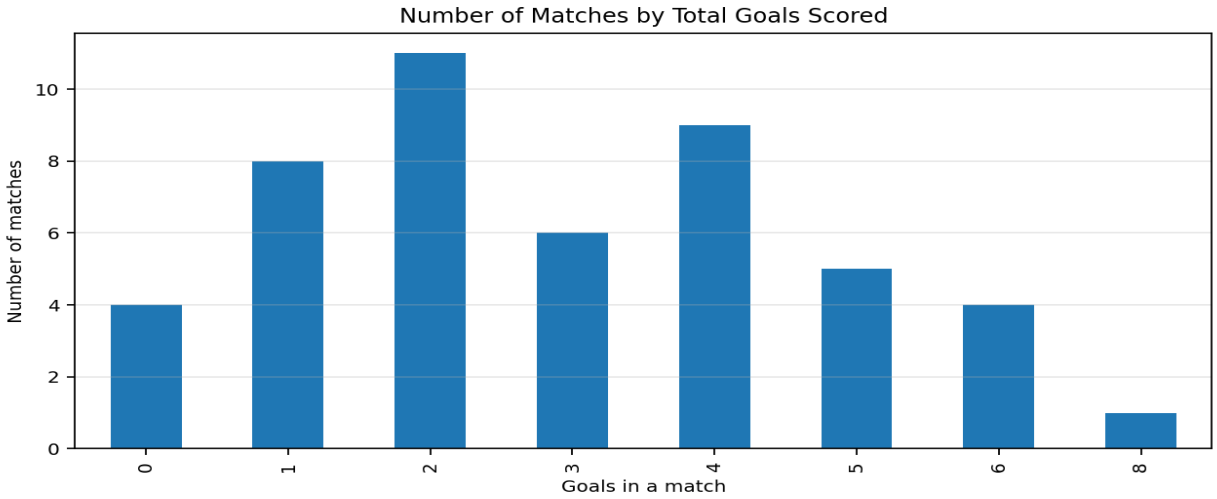

Compares the total number of goals recorded in each group represented in the sample.

Chart 5. Top 10 teams by goals

Ranks teams by goals scored in the included records only; it is not a full-tournament ranking.

Chart 6. Matches by goals scored

Shows how often matches in the sample ended with each total-goal count.

5. Summary findings

The dataset includes 48 matches and 141 total goals, averaging 2.94 goals per match. Result counts are 25 home wins, 9 away wins and 14 draws. These statistics describe only the sample included in the CSV.

6. How to recreate in Power BI

1. Import the companion CSV using Home → Get Data → Text/CSV.
2. Confirm Date is a Date field and goal columns are Whole Number.
3. Add cards for matches and total goals.
4. Add a line chart for Date vs Total_Goals, a pie chart for Result, and bar charts for group and team goals.
5. Add slicers for Group, Date and Result.

7. Important dataset note

The dataset is a 48-match sample, not the complete 2026 FIFA World Cup dataset. It is suitable for practicing Power BI visuals, but the included results and summaries should be verified against official tournament records before formal submission. The home/away labels reflect the dataset's listing order and do not necessarily indicate a true home advantage.
